

In terms of **places of interest** this could be the list:

- Barents Sea Gateway (Баренцево море)
 - Kola Bay (Кольский залив)
 - Murmansk Port (порт Мурманск)
 - Lavna Port (порт Лавна)
 - Arkhangelsk Port (порт Архангельск)
 - Kandalaksha Port (порт Кандалакша)
 - Kara Gate Strait (пролив Карские Ворота)
 - Ob Gulf (Обская губа)
 - Sabetta Port (порт Сабетта)
 - Uteny Port (порт Утенный)
 - Novy Port Oil Terminal (нефтяной терминал Новый Порт)
 - Franz Josef Land (Земля Франца-Иосифа)
 - Severnaya Zemlya Archipelago (архипелаг Северная Земля)
 - Laptev Sea (море Лаптевых)
 - Dudinka Port (порт Дудинка)
 - Tiksi Port (порт Тикси)
 - East Siberian Sea (Восточно-Сибирское море)
 - Chaun Bay (Чаунская губа)
 - Pevek Port (порт Певек)
 - Provideniya Port (порт Провидения)
 - Bering Strait (Берингов пролив)
-
- We have quite a few ideas regarding possible **vessel filters**, but we understand that not all of them are easy to implement, so it would make sense to focus on those that are most feasible technically. The options we are considering include, for example, ice class and flag (so that foreign-flagged vessels can be easily identified). It would be great if sanctioned vessels could also be seen but I think integration with OpenSanctions can be a bit complicated. By the way, regarding vessels with NSR permits and oil tankers older than 25 years - we do not see them in the filter menu yet (or maybe we just haven't found this info).
-
- **About this map** could include (draft, subject to change):

This interactive map helps you analyze vessel traffic and infrastructure pressure in Russia's Arctic waters along the Northern Sea Route between 2023 and 2025.

It visualizes how shipping activity has evolved over time, overlays the boundaries of protected areas, and allows you to identify when and where vessels crossed into these zones.

Using built-in filters, you can explore specific categories of vessels, track patterns of activity in key Arctic regions, and focus on areas where shipping, energy infrastructure, and environmental protection intersect.

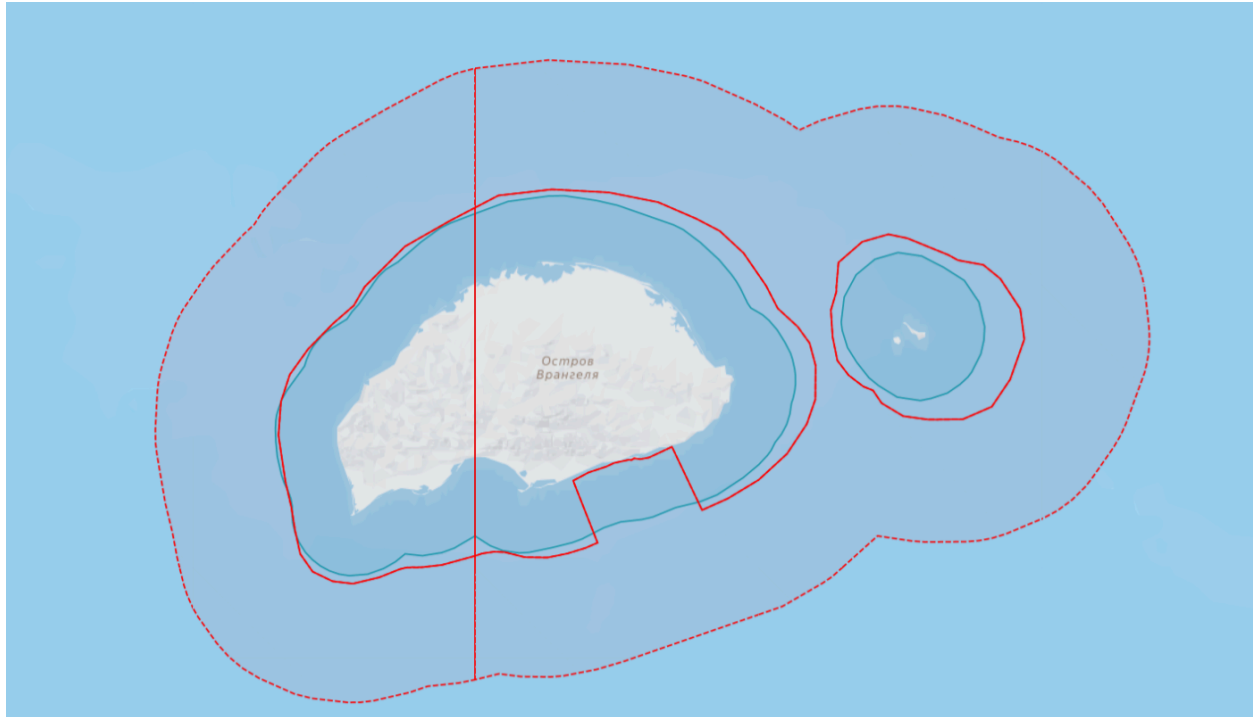

-

Questions:

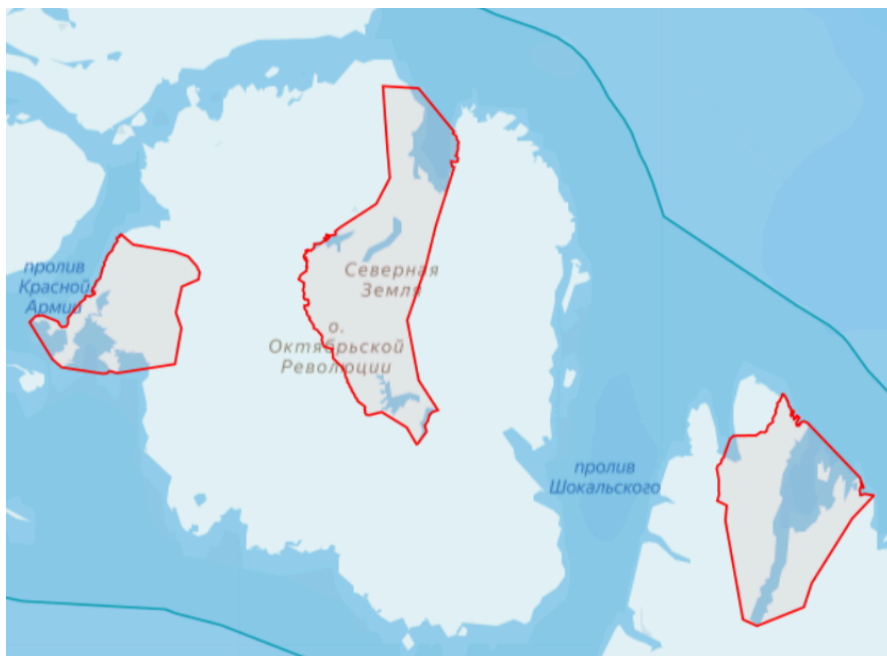

- For an external user it might not be entirely clear what a single unit of information on the map represents, specifically, a colored dot (vessel). Does this mean that the vessel was located at this point on the selected date (stopping location?)? The full track of the vessel (if a user wants to trace it is available if they go to Global Fishing Watch based on the information on the vessel when they hover on it, right?
Overall, this aspect is not very clear, but it seems fundamental, as these are the map's core data. This could potentially be addressed by adding explanatory text to the map.

Similarly, for cases of crossings into protected areas, does the date indicate that the crossing took place on that specific day?

- Protected areas have core boundaries (which are currently visible on the map), but they also often have buffer zones where certain activities may also be restricted. Could the buffer zones be visualized as well? In the original [map](#) from which the data is sourced, the core protected area boundaries are shown with a solid line, while the boundaries of the buffer zone are indicated with a dashed line (see the Wrangel Island example below). Accordingly, this information can be present in the *.shp files. This would allow for more accurate tracking of vessel crossings, as the rules for core protected areas and their buffer zones may differ.

- At the moment, land is shown in white, and the boundaries of protected areas are also rendered as a white dashed line. As a result, the boundaries of protected areas on land blend into the land background and are not visible – see the example below comparing how the same boundaries are displayed on the original map and on our map. Do you think another visual styling solution is possible so that it would be more clear?

Technical:

- Could we add Zoom In / Zoom Out controls?
- Could vessels be displayed in different shades of blue/white (in Arctida colors), or would that negatively affect visibility?
- Could we enable the ability to click on a protected area and display a brief info panel about it? We could later add details such as area size, name, and similar information ourselves.
